Chapter 1

Genealogical Tree

Summary

Program should be able to **find all the descendant with name Bob for all the ascendants with name Will on any level of ancestry**. In order to present the capabilities of your app:

- implement the application to optimize the initialization time
- application should have built in data about genealogical tree of people living in particular country
- please generate a representative data that has sample people and relationships between them. Use all varieties of names (can be also generated) but also put two test names (Bob and Will) and connect them in different relationships.
- the application should possess tests that are checking possible edge cases and ensure the stability of the application.
- the designed data structure should ensure optimized search time on following fields: name, last name, date of birth and location.

Generate binaries & documentation

Usual commands:

```
mkdir build
cd build
cmake ..
make
make install
make doc
```

Note: If you happen to work with *OSX* and *Homebrew*, don't forget to invoke *cmake* pointing to the **GNU** compiler:

```
cmake -DCMAKE_CXX_COMPILER=g++-5 ..
```

Note: If you happen to work with *Windows* and *Git/MinGW*, don't forget to invoke *cmake* pointing to the **GNU** generator:

```
cmake -G "MSYS Makefiles" ..
```

As well a script, called **show** or something similar, will be created in your *home* directory as a shortcut for generating & viewing documentation. Don't hesitate to use it as a *template* for your specific environment.

Generate only documentation

Similar commands to the previous ones:

```
mkdir build
cd build
cmake -DONLY_DOC=TRUE ..
make doc
```

Note: If you happen to work with *Windows* and *Git/MinGW*, don't forget to invoke *cmake* pointing to the **GNU** generator:

```
cmake -G "MSYS Makefiles" -DONLY_DOC=TRUE ..
```

Development details

In order to generate binaries & documentation, the following versions were used:

For code

Pay attention to *cmake* and *gcc* versions. A minimum is required to work on several O.S. using modern C++. Feel free to locally hack **CMakeLists.txt** to meet your needs.

Linux (Xubuntu 15.04)

- **cmake 3.1.3**
- **gcc 4.9.2**
- **boost 1.55**

OSX (Yosemite 10.10.3)

- **cmake 3.2.2**
- **gcc 5.1**
- **boost 1.58**

Note: If you happen to work with *OSX* and *Homebrew*, don't forget to compile **boost** with the previous **gcc** compiler, not with the default *clang* one:

```
brew install gcc
brew install boost --cc=gcc-5
```

Windows (Win7 x64)

- **cmake 3.3.0**
- **gcc 5.1**
- **boost 1.58**

For documentation

Environment variables to locate PlantUML *jar* and default *PDF* viewer can be defined to overwrite default values. See **CMakeLists.txt** for further information on your platform.

Linux

- **doxygen** 1.8.9.1
- **latex/pdfTeX** 2.6-1.40.15
- **graphviz/dot** 2.38.0
- **java/plantuml** 1.8.0_45/8026

OSX

- **doxygen** 1.8.9.1
- **latex/pdfTeX** 2.6-1.40.15
- **graphviz/dot** 2.38.0
- **java/plantuml** 1.8.0_40/8026

Windows

- **doxygen** 1.8.9.1
- **latex/pdfTeX** 2.9.5496-1.40.15
- **graphviz/dot** 2.38.0
- **java/plantuml** 1.8.0_45/8026

Note: Don't forget configure *Doxyfile* and *CMakeLists.txt* to use **README.md** as *Main Page* for **latex** documentation.

For IDE

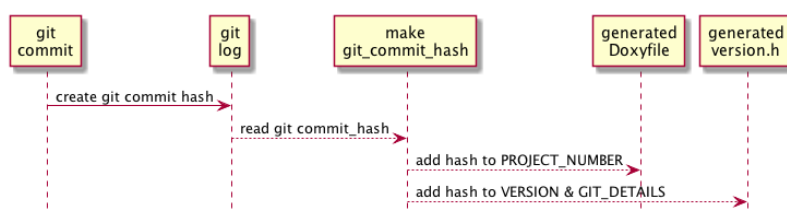

To use **NetBeans** don't forget to configure a *cmake* project with *custom build* folder. Add at that moment any extra customization in the command line used by *cmake* instruction. For example:

- `-DCMAKE_CXX_COMPILER=g++-5` for **OSX**
- `-DONLY_DOC=TRUE` for only documentation on **Linux/OSX**
- `-G "MSYS Makefiles"` for **Windows**
- `-G "MSYS Makefiles" -DONLY_DOC=TRUE` for only documentation on **Windows**

Note: If you happen to use *jVi* plugin on OSX, don't forget to use `**-lc**` instead of just `**-c**` for its `*/bin/bash*` flag.

GIT Commit Hash

In order to add the specific **git commit hash** into code & documentation, *templates* are defined in the *template* folder for **Doxyfile** & **version.h** files.

Chapter 2

Sources

Source folder for headers & code files.

Generate Files

[version.h](#) is generated with *GIT* information

Chapter 3

Tests

Future folder with *boost* test cases

Chapter 4

File Index

4.1 File List

Here is a list of all documented files with brief descriptions:

src/main.cpp	11
src/version.h	11

Chapter 5

File Documentation

5.1 src/main.cpp File Reference

```
#include <iostream>
#include <utility>
#include <algorithm>
#include <boost/graph/graph_traits.hpp>
#include <boost/graph/adjacency_list.hpp>
#include <boost/graph/dijkstra_shortest_paths.hpp>
#include "version.h"
```

Functions

- `int main (int argc, char **argv)`
Main function.

5.1.1 Function Documentation

5.1.1.1 `int main (int argc, char ** argv)`

Main function.

Parameters

<i>argc</i>	An integer argument count of the command line arguments
<i>argv</i>	An argument vector of the command line arguments

Returns

an integer 0 upon exit success

5.2 src/version.h File Reference

Macros

- `#define DEFINE_VERSION_FIRST "0"`
- `#define DEFINE_VERSION_MIDDLE "0"`
- `#define DEFINE_VERSION_LAST "1"`

- `#define DEFINE_GIT_DETAILS "498e68b (HEAD, develop) Let only documentation projects and removed warnings for Windows std::auto_ptr deprecated"`
- `#define DEFINE_GIT_COMMIT_HASH "498e68b"`
- `#define DEFINE_VERSION`

Variables

- static const char * **VERSION** = "VERSION = " `DEFINE_VERSION`
- static const char * **GIT_DETAILS** = "GIT_DETAILS = " `DEFINE_GIT_DETAILS`

5.2.1 Detailed Description

This metadata information might be located through **strings** command

- Linux/Solaris/Mac:

```
strings <binary> | grep VERSION
strings <binary> | grep GIT_DETAILS
```

- Windows (MinGW):

```
strings <binary> | findstr VERSION
strings <binary> | findstr GIT_DETAILS
```

5.2.2 Macro Definition Documentation

5.2.2.1 #define DEFINE_VERSION

Value:

```
DEFINE_VERSION_FIRST "." \
    DEFINE_VERSION_MIDDLE "." DEFINE_VERSION_LAST \
    "_" DEFINE_GIT_COMMIT_HASH
```
